Protein interactions and kinase regulation in Src family kinase signaling. Src family kinases (SFKs) represent a subfamily of nonreceptor tyrosine kinases that play critical roles in regulating diverse cellular processes. Although the individual SFKs are well-defined molecular entities, their function within cells is only beginning to be understood. An important first step toward understanding the physiological roles of SFKs is to elucidate the physiological regulation of their functions. In this review, we focus on the mechanisms of protein interactions and the role of phosphorylation in the regulation of SFK signaling. This invention relates to a combined chemical-mechanical polishing (CMP) apparatus and method. The CMP apparatus and method of the invention are particularly useful for the formation of planarization layers during the manufacture of integrated circuits (ICs). In the manufacture of ICs, planarization of the various layers that are formed on the wafer surface is increasingly important. With increased circuit densities, the wafer topography has become more complex, resulting in a need for a planarized wafer surface. Although there are a number of known planarization techniques, chemical-mechanical planarization (CMP) has become the most commonly used planarization technique. In conventional CMP, a wafer surface is contacted with a polishing pad under a controlled pressure in the presence of a polishing slurry. The polishing slurry contains abrasive particles that mechanically polish the wafer surface. The slurry is typically a mixture of deionized water and an abrasive such as alumina, silica, or ceria. In addition to abrasive particles, the slurry may contain chemicals that etch the wafer surface or oxidize the wafer surface. In conventional CMP, a wafer surface is polished for several minutes, but preferably for about 20-30 seconds, with the slurry delivered to the wafer surface by a slurry delivery system, such as a rotating brush or a

Alterations in the putative rate-limiting enzymes of lipid metabolism in adipose tissue after overfeeding. To investigate the metabolic function of adipose tissue in obese humans, we examined the relationship between changes in lipid metabolism and adipose tissue metabolic changes in 10 normal weight and 22 obese men, who were overfed for one month. Plasma concentrations of free fatty acids, glycerol, and triacylglycerol were significantly elevated, as were plasma insulin concentrations in the obese group. In addition, adipose tissue mass was significantly greater in the obese than in the normal-weight group. However, adipose tissue lipogenic enzyme activities and fatty acid synthase (FAS) mRNA expression in adipose tissue were significantly lower in the obese than in the normal-weight group. No significant differences in adipose tissue lipolytic enzyme activities between the groups were observed. Thus, overfeeding results in a significant increase in circulating free fatty acids and insulin concentrations. As a result, the adipose tissue mass in the obese group is significantly increased, but adipose tissue lipogenesis is suppressed. Furthermore, adipose tissue lipolysis is not stimulated. These data suggest that alterations in lipid metabolism in adipose tissue are important determinants of energy balance, and that the inhibitory response to insulin is altered in obese humans.

Pendleton Hill Historic District The Pendleton Hill Historic District is a historic district on the hill above a harbor in Fairhaven, Massachusetts. The area was developed in the early 19th century for the use of whaling ships, and is a well-preserved reminder of that industry's importance in early New England. The district was listed on the National Register of Historic Places in 1983. Description and history The area now housing the commercial district of Fairhaven was once called "Pendleton's Fields" and was the first area settled in the town. The original settlers were Edward Pendleton (1683-1766) and his son, John Pendleton (1724-1796). The estate of Pendleton Hill was part of this 2d92ce491b
