Flip It! Flip It! is a fun word game for two to five players. Flip It! uses card play and has 1-10 scoring, as well as an "Out of Play" space which allows the scores to be totalled for a game in which the two sides play out. Play The first player to have a card face up on a player's side of the table wins the round. On a player's turn, they may flip the card face up to reveal a new word, or they may choose to turn over a card. If they choose to turn over a card, they must flip a word if they choose to flip the card. If the player flipped the card and chose not to turn it over, they win the round and play continues with the next player. If they choose not to flip a card, they may not play a card until they have a word face up on their side of the table. Each player can make up to five moves on a round. Scoring Each player starts with a score of 50 points. If a player turns over a card to play a word and chooses not to flip the word, they lose 50 points. The last player to win the round earns 100 points for their score. The Out of Play Space The Out of Play Space is not used in play, but instead is used to total the scores of the game. If the two sides are tied on a round, the Out of Play space

Urologic manifestations of non-muscle-invasive bladder cancer. Non-muscle-invasive bladder cancer (NMIBC) is a heterogeneous disease with variable rates of progression. The characterization of NMIBC based on urologic manifestations is an important and common clinical tool for the management of patients. Recognizing the differences in the rates of recurrence and progression is the key to the proper management of patients with NMIBC. Molecular characterization may be useful for sub-typing of NMIBC in an effort to personalize therapy. The molecular characterization of NMIBC is an emerging area of research and may be used to define new sub-types of NMIBC with variable rates of progression. Ultimately, it is hoped that the molecular characterization of NMIBC will improve our management of patients with bladder cancer.

Tyrosine kinase is important for MAPK activation and matrix metalloproteinase-9 induction by ethanol in keratinocytes. In the present study, we investigated the effect of 12.5 mM ethanol on MAPK activation and matrix metalloproteinase (MMP) production in human keratinocytes. Exposure of HaCaT keratinocytes to ethanol induced phosphorylation of MAPK and MMP-9 production in a time-dependent manner. Effects of ethanol were inhibited by treatment 2d92ce491b
