Keymacro is a powerful, easy-to-use and small command line utility that can turn text or key words into a macro for programs such as Notepad, Word or Excel. KEYMACRO allows you to create a short sequence of keystrokes that can be used instead of typing in a large amount of repetitive text. With the help of the program you can convert text into a macro that can perform actions such as opening a specific file, opening a new Notepad window, opening a Word document or opening a specific Excel worksheet. What is new in this release: + Created a new set of support emails for people who have problems with the program. + Updated the About dialog box. + Several improvements for better performance. Keymacro is freeware. You can find more information about it at So for a basic two-word combination, say "qwertyuiopasdfghjklzxcvbnm", you need a total of 18 characters, for the first word plus nine for the second plus a few to make it into one complete string. This is not one of those situations where a dictionary lookup is more efficient. For this you need to define a dictionary that is composed of a specific language and a dictionary. There are a lot of very useful dictionaries out there for English, some free and others of course also paid. In my case, I have a paid dictionary that has a big list of abbreviations of all kind of things. Say, for example, a list of abbreviations for words and phrases in English that I would use a lot, or simply a list of some random words I often use in text, say, news stories. Those dictionaries also define their own number of lookups per second and also the speed at which the dictionary needs to be updated. Those are

both important for the performance of the program. These settings can be set in the Options dialog box, after a run. The range of possible strings you might enter and the way they are being encoded is defined in the Keygen screen, after a run. The Format screen is where you change the number and speed settings for what they will be encoded into. All in all, it is a very flexible way to get the job done. To the best of my understanding, "cache" is a managed object that is being stored for the lifetime of a request or application. I know of the MemoryCache class in.NET and the DbCaches mentioned in the Asp.Net MVC docs. I'd like to use these in Autofac. My question is: what's the difference between cache and memory in Autofac? Or is this just an implementation detail
