version 3 for free. Education
software downloads - PANalytical
X'Pert HighScore Plus by
PANalytical B.V.. Download xpert
highscore plus 2.0 free for windows.

Category: PANalyticalQ: Parsing
function's argument in Python I
have a little bit of a problem, I need
to parse a string in python. Here's an
example: >>> def
foo(arg,bar=None,*baz): print(arg)

```
print(bar) print(baz) >>>
foo("name") name None ('name',) I
need to output to look like this: >>>
def foo(arg,bar=None,*baz):
print(arg) print(bar) print(baz) >>>
foo("name") name None ('name',)
So basically, I need the arguments
parsed from the call. I tried using
argparse but it's a little bit more
complex and I just need to print the
arguments after calling it. How do I
do that? Thanks! A: Use the Python
function unpacking: def foo(arg,
bar=None, *baz): print(arg)
print(bar) print(baz) This should
print: foo("name", None, "name",)
You may want to use argparse if you
```

want to support command line arguments. It's a lot more flexible and powerful. As for parsing argv into a function call, you would do something 4bc0debe42
