Most of this book is directed at individuals who are interested in learning how to use Photoshop to create and modify images, explore the features, and maintain image quality and balance. You need to be comfortable with a computer and grasp the basics of photo and image capture. You may need to know rudimentary computer skills. ## Starting with the Basics Every image begins life as a captured photo and may be worked on further in the form of an image file. You need to know a few basic concepts about digital photography before you jump right into Photoshop. ## Understanding the Basics of Digital Photography With a digital camera, you don't record an analog image. You _see_ what you capture. In reality, the image comes into a computer or camera as a series of dots, each a tiny bit of a given color, called a _pixel_. Each pixel represents a certain color, which, in turn, creates the impression of a color on the picture. In the digital camera, the sensor in the camera takes in the light that hits the lens of the camera, and the picture is recorded on the camera's memory card as a sequence of dots that are put in rows, or _scanlines._ The value of each dot on the scanner is represented by a value from 0 to 255, with the largest amount of light representing a white, or 255, value, and the least amount of light representing a black, or 0, value. Digital cameras have two basic components that read the light that hits the sensor. In many of the cameras that have been on the market for some time, the two components are placed _back-to-back_ —one behind the other. The rear element produces the image in three dimensions and records the light that hits the lens, while the front element reads light that hits the sensor and records it. The front element in digital camera sensors is often referred to as the _image sensor._ Some digital cameras have an _APS-C_, or _APS-H_, or _APS-C/APS-H_, sensor, which is a crop of the image that comes from the rear element. The image sensor converts the light that hits it into a three-dimensional (3D) array of numbers that can be mathematically manipulated to give you the final image. Photoshop and other image-editing programs use three basic color models: RGB, CMYK, and Lab. Each model represents a different light source and offers slightly different

Collapse of an anti-satellite (ASAT) missile is shown here on October 19, 2007. Credit:Reuters/AP It has been just over a month since the United States military launched two directed-energy weapons (DEWs) against a Russian satellite. Many believed the administration of President Barack Obama would refrain from such action but that has not proved to be the case. Last week, the U.S. Missile Defense Agency (MDA) used two DEWs to destroy an old Russian ASAT missile in low orbit. The DEWs targeted and hit the missile less than three minutes after it was launched from the Plesetsk Cosmodrome in north Russia on February 20, on the heels of a U.S. ground-based interceptor missile shot down a long-range missile target on a launch pad. US President Barack Obama has repeatedly said that he does not want to get involved in the ongoing Russian-Ukrainian conflict, but U.S. officials are now confirming that the DEWs destroyed an ASAT missile (see more below). The three-year-old missile, Kosmos 2519, was a new Russian ASAT, capable of a range of over 9,200 miles. It was first observed on November 20, 2008, by NATO's early warning satellite, Egnat-1. The U.S. early warning satellite, the Defense Support Program (DSP), detected it on February 20 and tracked its activity for several weeks, "monitoring the missile's long-range capabilities," according to The New York Times. In addition to tracking the missile, the U.S. military had the DEWs ready, having previously tested them against simulated targets, according to the paper. Because of the technical capability to target the missile, officials are confident that, had it not been for the DEWs, the missile would have been shot down. On the day that the missile was destroyed, a U.S. Space Command (SPACECOM) official said: "We had a technical solution. We knew where it was going and we had an intercept means. If that missile were to reenter the earth's atmosphere, it could do significant damage." Earlier this month, a second, older Russian ASAT missile was destroyed by U.S. airborne infrared sensors, although the U.S. military has played down the significance of this event. The Pentagon says the U.S. Air Force's Global
