Common disease/common variants (CD/CV) hypothesis of autoimmune diseases. Systemic autoimmune diseases (AID) are common and devastating diseases. More than a hundred different AIDs are known, some of which, such as type 1 diabetes, are lethal. The aim of this review is to examine the hypothesis that AID are due to many common genetic variants (CD/CV hypothesis). To test this hypothesis, the risk alleles identified for AID and other common diseases and the mechanisms of their action are examined in light of the available data. The CD/CV hypothesis of AID is supported by the identification of common risk alleles for common diseases and AID in GWAS (genome-wide association study), by an overlap of expression and function of risk genes in AID and other diseases, and by functional studies of a risk gene (a Mendelian disease gene in this review) in AID. However, even if a high proportion of AID are caused by many common risk alleles, 4bc0debe42
