***Photoshop Elements** A basic version of Photoshop with fewer features (including layers) than Photoshop, available at `www.adobe.com`. * **GIMP:** A highly functional open-source alternative to Photoshop with a similar look, photo manipulation tools, and many editing features (`www.gimp.org`). As I mention in the nearby sidebar, all image editing programs carry similar abilities, but the tradeoffs of these programs can make it more difficult to find what you want or need. For a tool that will help you when you don't know the name of what you want to do or where to find it, Adobe Photoshop Elements is the way to go. ## To Photoshop or Not to Photoshop: That Is the Question! The mouse is the defining tool in Photoshop. Just about everything you do involves mouse movement: Selecting, moving, resizing, cropping, painting, and so on. In all image-editing software, the mouse is the primary tool, because you can move your cursor with two fingers or use trackpad or mouse roller wheels to zoom in or out. You can use the Command key (the "⌘" symbol) to access many Photoshop features or shortcuts (a type of keyboard command). You must hold down the Command key or a shortcut such as Ctrl+shift+Z to activate keyboard shortcuts. In addition to the shortcuts, the Photoshop interface provides several tools (layers, filters, selection tools, and so on) that let you perform many operations on an image. ## A Quick Tour of the Photoshop Interface The Photoshop interface is extremely sophisticated. I'll introduce you to the most useful menus and dialog boxes in this sidebar.

Q: How to make sure that the user has not already used the same email twice? I have a site where the user signs up for a new account. I then take the user's information and make it available to their account on my other site. When I save the user's information, I do a query to my database to look for another account with the same email address. If the record exists, I do not add the info to the other site's database. If the user signs up twice with the same email address, they get two records created in the table in my database, and they will always be added to the database when they use the account on the other site. If they have an existing account and sign up again with the same email, it will overwrite their existing account and all their information won't be saved. My question is what's the best way to prevent this from happening? My first thought is to not add the email address to the database if it already exists, but I don't know if I can do that. I'm hoping there is some sort of way to check if the email address is still available or something, and if it is, then do nothing. A: IF EXISTS (select * from...) or EXISTS (select * from... where...) update... ELSE INSERT... The above should work if you don't need to update that row in a large list of existing entries. Q: How to map multiple function handlers to a single lambda? I'm trying to bind multiple function calls to a single lambda. I have two functions, which I would like to pass through the same lambda: - (void)test1:(id)arg1; - (void)test2:(id)arg1; These should all be passed to the same callback function: [myObj myFunc:^(id arg1) { }]; In the real code, there are various other handlers which should be bound to this specific callback. I've tried the following in my Obj-C class: - (void) myFunc:(id (^)(id arg1))callback; I get an error on myFunc: No visible @interface for NSObject declares the selector *

Introduction [#sec1-1] ===== In recent years, the relationship between gene amplification and protein overexpression has been well documented in human cancers.[[1]] Breast cancer is the most common malignant neoplasm among women, and one third of human breast cancers contain an amplified c-erb-B-2 oncogene.[[2]] It is also one of the leading causes of death in women in the developed countries.[[3]] At the current time, evidence-based treatments for breast cancer are surgical, chemotherapeutic, and radiotherapeutic options, while novel therapeutic strategies are in development.[[4]] Molecular imaging has been increasingly used for providing non-invasive diagnosis and monitoring of human cancers.[[5]] The ultimate goal of molecular imaging is to provide visual information about biological processes at the molecular and cellular levels.[[6]] Optical molecular imaging requires the use of optical detection techniques such as fluorescence imaging, photodynamic therapy, ultrasound, and magnetic resonance imaging, for different applications.[[7]] In this context, dyes as a fluorescent probe are increasingly used for sensitive and non-invasive detection and monitoring of various cancer types.[[8]] Fluorescence imaging and spectroscopy are now being used in clinical practice for *in vivo* evaluation of various tumors and other intracellular events.[[9]] Molecular imaging provides molecular information for all phases of cancer development, including diagnosis, staging, prognosis and/or monitoring, and recurrence.[[10]] The precise detection of cells with altered expression levels by *in situ* hybridization techniques has been based on the high sensitivity and specificity of nucleic acid probes. *In vivo* molecular imaging procedures in cancer gene therapies have been based on the use of oligonucleotide probes labeled with reporter molecules such as indium-111-DTPA, fluorine-18-fluorodeoxyglucose (FDG), copper-64-nanocolloid, or near-infrared (NIR) emitting fluorophores.[[11]] On the other hand, diagnostic imaging is the branch of imaging that
