explain what my problem is. I have a two-partition hard drive with WinXp on the first partition, and Ubuntu 9.04 on the second one. I wanted to install a new version of Ubuntu (9.10 Karmic Koala) but I had a few problems with my first try, so I decided to create a new partition

on the same hard drive. So here is how it happened: 1) I had no problems with installing Ubuntu 8.10 Intrepid Ibex. My partitioning scheme was: a) 250 GB NTFS for XP and b) 30 GB ext3 for Ubuntu. 2) When I tried to install 9.04 Jaunty Jackalope, I had problems with booting the live CD:

my computer went to sleep and never woke up. The first suspicion that came to my mind was the BIOS settings. So I changed the settings and got the same problem. That didn't help either. 3) I decided to check the fstab file and noticed the next thing in it: U
UID=9CBE6607BE660
7D4 / media

auto,user,exec,utf8 0
0 and I wasn't sure
what to do. So I got
some help from a
forum and all I did to
solve my problem was
to replace the uuid I
got on the website (in
the given file) with
the one on my hard
drive. I also had to
add a "LABEL=boot"
at the end of the fstab
line. 4) Now I could

boot the live CD for 9.04! I don't know why I had this problem in the first place, but I hope this helps to solve your problems too. Best regards, mikey As many of you know, GTA,
